

AIS Managed SIEM

AIS Managed SIEM provides real-time peace of mind for SMBs

Technology has transformed what's possible for today's small and medium-sized businesses, but it also increases exposure to potential security risks. The AIS Managed SIEM (Security Information Event Management) platform changes all that with enterprise-level, cost-effective protection for SMBs.

AIS Managed SIEM supports threat detection and security incident response through real-time collection and historical analysis of security events from a wide variety of event and contextual data sources. The platform acts as a single portal for centralized security and event log collection, monitoring, analysis, and alerting.

Why AIS Managed SIEM is Different?

AIS combines access to an experienced team with an innovative approach to technology to eliminate the high cost and complexity typically associated with enterprise SIEM platforms.

Delivery The SIEM can be delivered solely as a managed SIEM platform or as a turnkey managed service. AIS' IT consultants can implement, configure, and maintain the SIEM, while its SOC team can monitor and respond to security alerts.

Technology The platform architecture utilizes both proprietary code and open-source packages, allowing for efficient development that results in faster-to-market functionality and more robust product features.

Integration AIS Managed SIEM is agnostic in terms of device brand and infrastructure architecture. It can aggregate information from network-connected devices as well as on-premise, cloud (AWS, Azure, etc.), and third-party SaaS tools, or even hybrid infrastructure architectures.
